Designed for Simplicity

**V2-C APPLICATION**

The Cleaveland/Price V2-C is a three pole, group operated, copper vertical break switch for installation in substation or distribution line locations. The switch can be mounted in the horizontal-upright, vertical, or horizontal-underhung position. The V2-C is suitable for use in a variety of applications including line disconnecting and sectionalizing, circuit breaker by-pass and isolation, and transformer isolation.

Arc horns or quick break whips are supplied when small amounts of transformer magnetizing currents and line charging currents must be interrupted.

Accessories and options needed to adapt the switch to a customer’s particular requirements are available. The V2-C may be manually operated by use of a swing handle or wormgear mechanism or electrically operated by use of a type TP-C2 motor operator.

The V2-C is designed to meet NEMA and IEEE Standards and the rating requirements of applicable IEC Standards.

---

**Permanently lubricated, maintenance-free sleeve bearing.**

**Rotating insulator bearing does not extend below the housing base to interfere with the mounting structure.**

1. Unbreakable, non-cast copper terminal pads with NEMA standard hole pattern
2. Fully insulated journal bearing
3. Unbreakable, non-cast operating crank
4. Stainless steel counterbalance springs that are insulated from the current path
5. Hard-drawn, high conductivity copper current-carrying parts
6. Silver-to-silver contacts at hinge and jaw
7. Stainless steel contact springs insulated from the current path
8. Hard-drawn, high conductivity copper contact fingers at hinge and jaw
9. Plain or tin-plated terminal pads
10. Hot-dipped galvanized steel base
PROBLEM: When the switch blade on a conventional switch rotates in the break-jaw to the final blade position, it does not consistently stop at the point of optimum contact pressure. The resulting inadequate contact pressure may cause contact pitting and burning.

Many switches use a stop on the rotating insulator to try to set proper blade position. This type of stop is too remote from the blade to accurately control the blade motion because of the cumulative play in the linkage joints. Variation in the speed of the operator can actually affect the amount of blade turnover.

SOLUTION: On the Cleaveland/Price V2-C, the blade stop is on the blade itself instead of an intermediate linkage point (the rotating insulator). The V2-C stop location assures that blade rotation in the break-jaw will accurately and consistently stop at the point of maximum contact pressure.

The cutaway view shows how the unique Cleaveland/Price turnover stop allows the blade to rotate until the slot in the blade engages with the hinge pin. This sets the proper turnover angle. The stop angle is factory-machined for built-in accuracy. No matter how fast or slow the blade moves, it doesn’t stop moving until it has fully turned over.

CLEAVEELAND/PRICE FEATURES FOR OUTSTANDING PERFORMANCE AND LONG LIFE

The V2-C is made of the finest materials for dependable, trouble-free service. Knowledge gained from maintaining switches in the field for over 60 years has played a major part in refining the V2-C. Significant design features include:

- Total non-cast copper and steel construction resulting in the superior dependability of parts
- Live parts constructed from hard-drawn, high conductivity copper producing stronger, more conductive components than parts made of cast materials
- Silver-to-silver moving contacts
- Open construction of the hinge and smooth non-cast surfaces throughout, enabling the V2-C to break ice with amazing ease
- Wiping action on both the break-jaw and hinge keeps contacts clean for years of reliable service
- Visible hinge contacts allow easy verification of contact condition without disassembly
- Reverse loop electromagnetic design at hinge and break-jaw on all ratings gives outstanding performance under fault conditions
The Cleaveland/Price V2-C is an advanced design vertical break switch with features of genuine value to the customer. It incorporates several patented improvements:

1. Positive blade turnover stop is the key to consistent and complete contact pressure to prevent contact burning.
2. Insulating journal bearing prevents current flow through the live operating linkage.
3. Floating break-jaw contacts allow blade and break-jaw fingers to move together under short circuit and seismic duty to outperform conventional contact systems.

**UNIQUE BREAK-JAW DESIGN**

Short circuit tests prove that the V2-C break-jaw is superior to conventional break-jaws. On the V2-C, phase-to-phase electromagnetic forces that pull the blade side-to-side do not decrease the contact pressure since the fingers of the jaw are joined together to create a floating spring system that moves with the blade. Maximum contact pressure is maintained on all contact surfaces during short circuit and seismic events.

ANSI standards require that a switch pass the rated short circuit test only once. Standards also allow live parts to be changed for each test. The V2-C gives greater confidence in short circuit performance as demonstrated by 12 consecutive test shots on a 2000 amperes switch using the same set of live parts.

**PIVOTING HINGE**

During installation, the blade may be misaligned with the break-jaw, requiring adjustment of the insulators. However, it is often easier to pivot the blade to attain alignment with the jaw contact. This is particularly true when bus and ground blades have been installed at the jaw terminal and the blades are not perfectly adjusted. By loosening the bolts that attach the hinge and jaw to the stationary insulators and closing the switch, the blade and jaw automatically seat themselves in the proper alignment. Retighten the bolts and the adjustment is complete without having to realign the ground switch or bus.

Swing Handle Operator

Handcrank Operator

Motor Operator Type TP-C2

Standard Operator Features
- Swing handle operator
- Padlock provision in both the open and closed positions
- Ground strap for vertical operating pipe
- Adjustable stops
- Clamp-on open/closed indicators
- Self-lubricating, maintenance-free outboard bearing
- 1-1/2” IPS galvanized steel vertical operating pipe
